

Raspberry Pi setup for the Young Coders classroom (Beginner)

Equipment you should have:

- Raspberry Pi board and case
- power supply
- monitor and HDMI cable
- keyboard and USB connector
- mouse and connector
- SD card, with Raspian image
- (you will also have the wifi dongle that came with all the kits – do NOT install this for the beginner class)

Once the board is in its case and all the peripherals are plugged in, turn on the monitor. You should see the initial installation screen.

Setup:

1) Select only the first installation option, for 'Install Raspian' - do not select any other options

2) Click the Install icon

3) If you get a popup asking if you want to overwrite the existing operating system, select YES. Move on to the next Raspberry Pi - this initial installation step will take a few minutes

4) When the installation step finishes you should see an 'OS Installed' message – click 'OK' to continue

5) When the desktop comes up, go to the top lefthand corner and select Menu > Preferences > Raspberry Pi Configuration

6) Make the following localization changes:

Locale:

Language: EN

Country: US

Keyboard:

Country: United States

Variant: English (US)

Timezone: US (Pacific)

Once all these preferences are saved, you will probably be asked to reboot.

7) Once the reboot is complete, make sure there are icons on the desktop for:

- Idle (Python 3)

- Pygames

9) For the beginner class, there will be some thumb drives floating around with content that needs to be copied to the desktop – check with one of the organizers. When you insert the thumb drive into one of the USB ports on the RPi, a file manager should open automatically to allow you to drag files to the desktop.

If you make a mistake and need to modify the configuration in some way, run this from the command line:

```
sudo raspi-config
```
